### **MICA 325**

### **DESCRIPTION**

Mica or Muscovite is a platelet or lamellar structured industrial mineral which can be described as a potassium, aluminium silicate. Mica in the native form occurs in the presence of pegmatites and is mined in pod-like outcroppings. In a specialised delamination procedure, the native muscovite ore is reduced in size, ensuring that the individual flakes achieve the highest possible aspect ratio.

#### **USES**

Mica is an excellent functional reinforcing filler in a wide range of industrial applications including: paints, gypsum and cementicious based plasters, polymer systems and board manufacture.

### TYPICAL CHEMICAL ANALYSIS

SiO <sub>2</sub>	53%
$Al_2O_3$	33%
SiO <sub>2</sub> Al <sub>2</sub> O <sub>3</sub> Fe <sub>2</sub> O <sub>3</sub>	0.1%

## TYPICAL PHYSICAL ANALYSIS

Particle Sizing	0% retained at 45µm
	Max. 15% retained at 10µm
	•
Oil Absorption	35% (Linseed Oil)
Specific Gravity	2.7(Helium Displacement)
Hardness	1 (Mohs)
Reflectance	75 (Opacity Reflectometer)
Melting Point	Heat stable up to ca. 900°C
рН	7,7
Appearance	White powder
Bulk Density	Loose: 370g/l
•	Tapped: 510g/l
Packaging	25kg polypropylene bags,
	packed into 500kg bulk bags
	I.
